iResume Review

A Cognitive Walkthrough

Pros

1. The idea behind the dynamic password function is good.
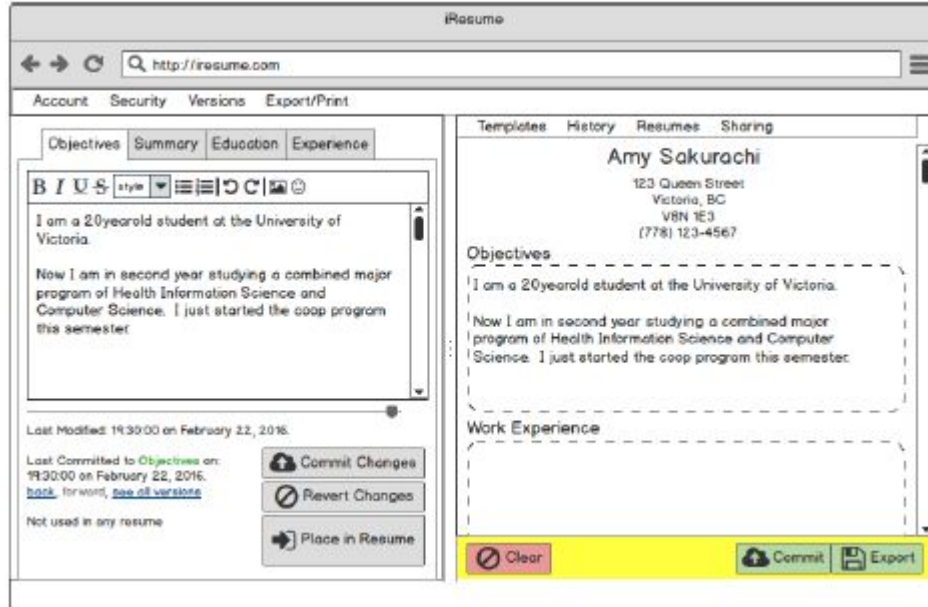

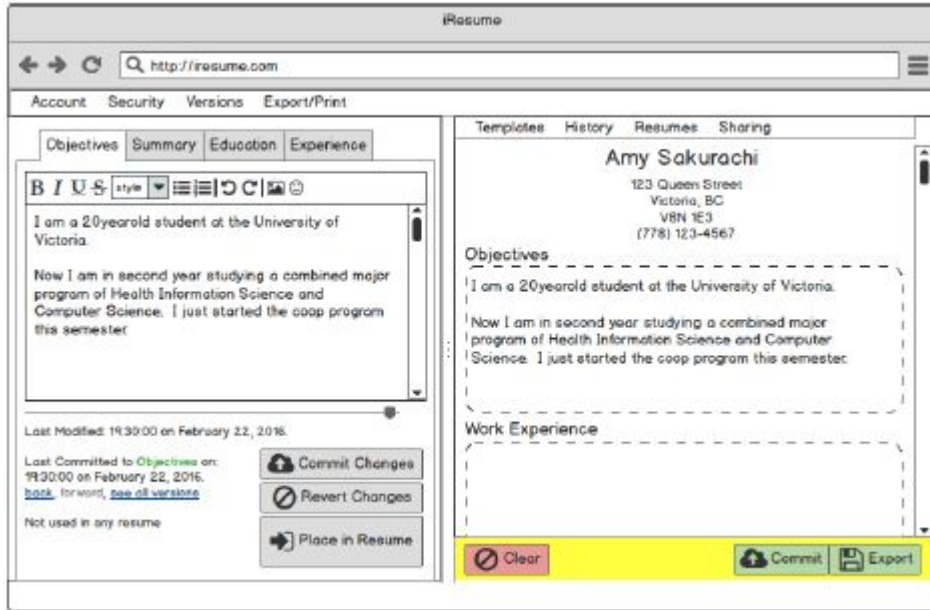

Pro

2. The buttons on the mainpage is good with eye catching colors and small icons on it

PRO

3. The two screens designs of the main page is good

Cons

First of all, this prototype is a mix of Windows system and Mac OS, which seems very odd. It is better to keep consistent and use only screenshots from one system.
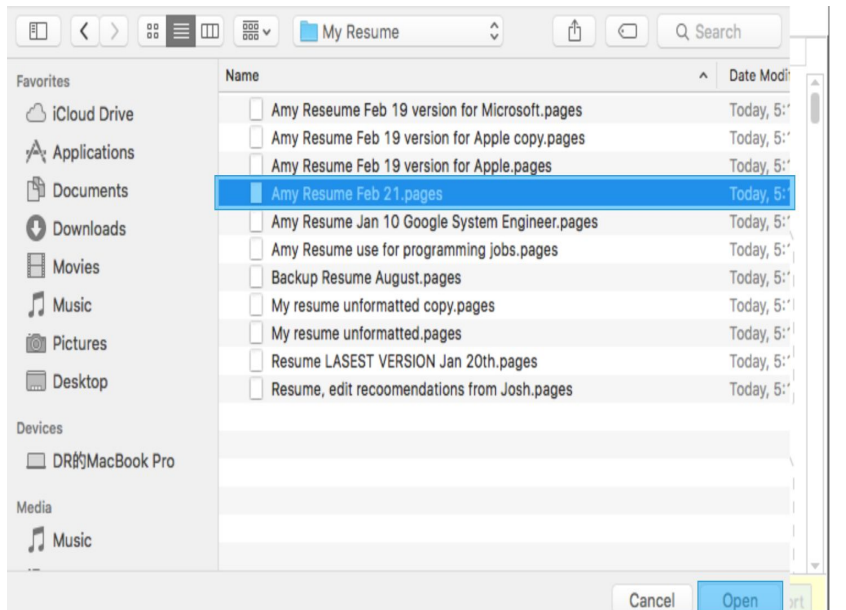

COns

--- Checkbox consistency:

Two different styles of checkbox are used and one of them doesn't have feedback. Once the user choose the file, the box will not be checked.

We suggest not use checkbox since there is no need to use it. Because the user can only process one resume at a time, the user can only upload a file at a time.
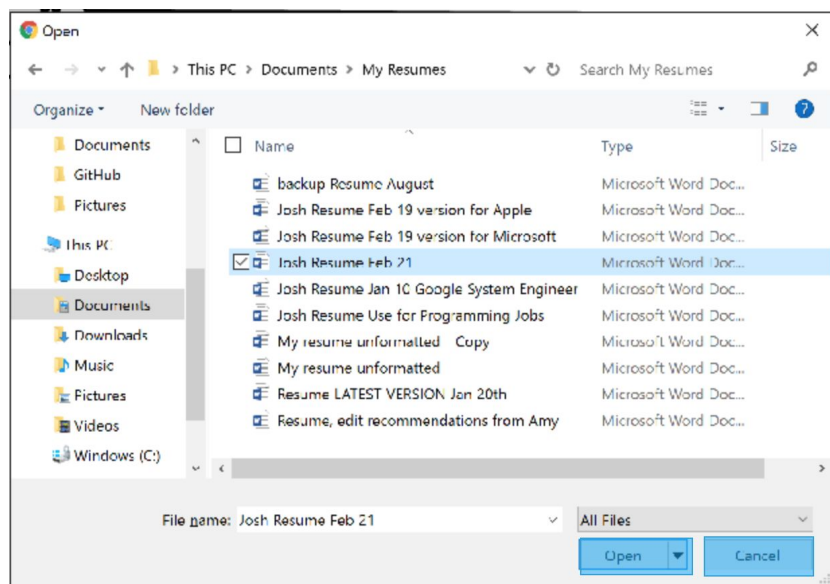

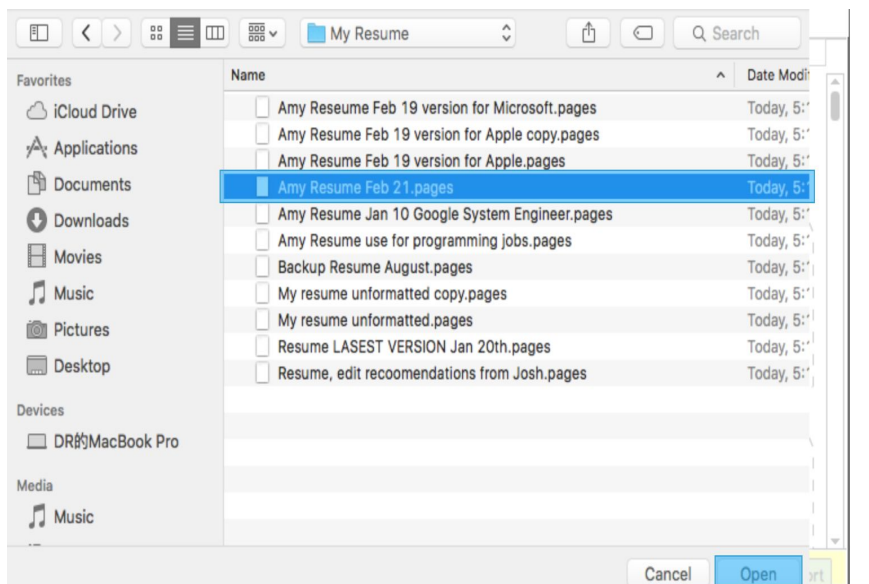

CONS

"Connect to Linked" button should be replaced by "Connect to LinkedIn".
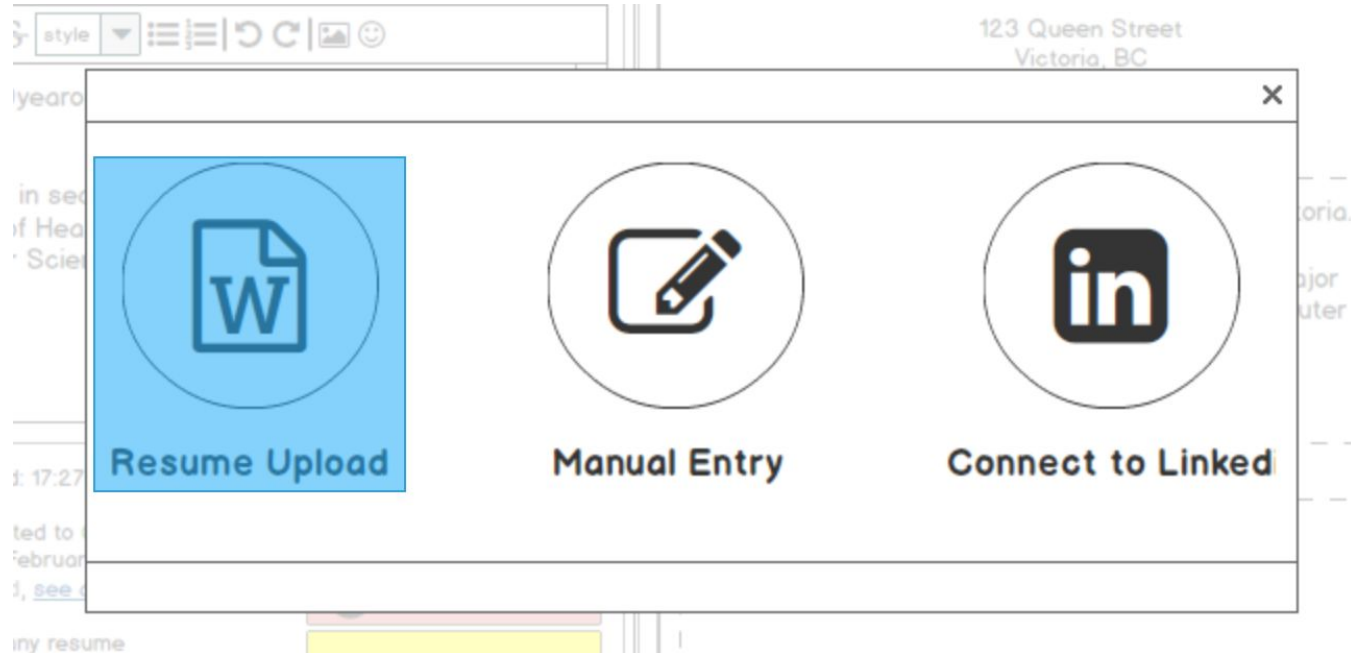

CONS

---Login page "Help" button consistency:
   One with question mark beside it, one is not. Either change "Help" to "Help?" or change "Help?" to "Help".

CONS

- Consistency issue regarding the "Versions" tab. Most software would label this tab as "File". This tab is also usually located furthest to the left.

Recommendations

- An "account recovery" can be made in conjunction with the dynamic password.
- The purpose of the dynamic password needs to be refined.
- In Josh's use case, the system "automagically" extracts resume information. However, resumes are often formatted differently with different software. How will iResume's implementation to take account for this?
